SPYGLASS
PHARMA™

HOW IT WORKS

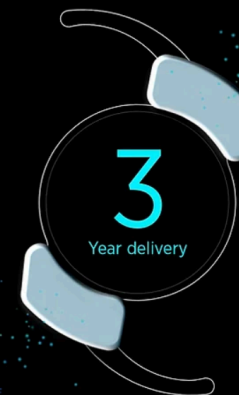

During cataract surgery, your doctor will implant the SpyGlass IOL that is uniquely designed to provide both good vision and allow for drug eluting pads to be secured to the IOL.

These drug pads have multiple years of IOP-lowering medication in them that will slowly elute a small amount of medication every day.

An Intraocular Lens (IOL) for patients having cataract surgery combined with multiple years of medication to lower pressure from inside the eye

The SpyGlass IOL uses the same material as other commercially available IOLs.

Targeting 3-year delivery of bimatoprost for cataract patients with either glaucoma or ocular hypertension

Bimatoprost is an IOP-lowering therapy that has been FDA approved for over 20 years and has been used by millions of patients around the world.
